# Developing Targeted Therapies in Low-Frequency Molecular Subsets of a Disease Guidance for Industry

## *DRAFT GUIDANCE*

**This guidance document is being distributed for comment purposes only.**

Comments and suggestions regarding this draft document should be submitted within 60 days of publication in the *Federal Register* of the notice announcing the availability of the draft guidance. Submit electronic comments to <https://www.regulations.gov>. Submit written comments to the Dockets Management Staff (HFA-305), Food and Drug Administration, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852. All comments should be identified with the docket number listed in the notice of availability that publishes in the *Federal Register*.

For questions regarding this draft document, contact Michael Pacanowski (CDER) at 301-796-3919 or the Office of Communication, Outreach, and Development (CBER) at 800-835-4709 or 240-402-8010.

8 This draft guidance, when finalized, will represent the current thinking of the Food and Drug  
9 Administration (FDA or Agency) on this topic. It does not establish any rights for any person and is not  
10 binding on FDA or the public. You can use an alternative approach if it satisfies the requirements of the  
11 applicable statutes and regulations. To discuss an alternative approach, contact the FDA staff responsible  
12 for this guidance as listed on the title page.  
13

14  
15  
16  
17 **I. INTRODUCTION AND BACKGROUND**  
18

19 Insights into the molecular basis of disease have led to the development of targeted therapies.<sup>2</sup>  
20 Often, the pharmacological effect of a targeted therapy is related to a particular molecular  
21 alteration.<sup>3</sup> Many clinically defined diseases are caused by a range of different molecular  
22 alterations, some of which may occur at low frequencies, that impact common proteins or  
23 pathways involved in the pathogenesis of diseases. In a population of patients with the same  
24 clinical disease, the heterogeneity in the molecular etiology may result in different responses to a  
25 particular targeted therapy. However, certain targeted therapies may be effective in multiple  
26 groups of patients who have different underlying molecular alterations. Therefore, FDA is  
27 providing guidance on the type and quantity of evidence that can demonstrate efficacy across  
28 molecular subsets within a disease, particularly when one or more molecular subsets occur at a  
29 low frequency.  
30

31 The purpose of this guidance is to describe: (1) the FDA's current recommendations on how to  
32 group patients with different molecular alterations for eligibility in clinical trials; and (2) general

---

<sup>1</sup> This guidance has been prepared by the Office of Translational Sciences in the Center for Drug Evaluation and Research in cooperation with the Center for Biologics Evaluation and Research at the Food and Drug Administration.

<sup>2</sup> For the purpose of this guidance, a *targeted therapy* is defined as a drug intended for populations that are subsets of clinically defined diseases and that are identified by using diagnostic testing. For the purposes of this guidance, all references to *drugs* include both human drugs and therapeutic biological products unless otherwise specified.

<sup>3</sup> For the purpose of this guidance, *molecular alteration* refers to a broad array of molecular changes in DNA, RNA, or protein, including point mutations, gene fusions, mutational load, epigenetic changes, and over- or under-expression. *Molecular subset* refers to a subgroup of the clinically defined disease caused by a specific molecular alteration or group of molecular alterations that are observed in the clinical disease.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

33 approaches to evaluating the benefits and risks of targeted therapies within a clinically defined  
34 disease where some molecular alterations may occur at low frequencies.<sup>4</sup>  
35

36 In general, FDA’s guidance documents do not establish legally enforceable responsibilities.  
37 Instead, guidances describe the Agency’s current thinking on a topic and should be viewed only  
38 as recommendations, unless specific regulatory or statutory requirements are cited. The use of  
39 the word *should* in Agency guidances means that something is suggested or recommended, but  
40 not required.  
41

63

### **A. Identification of Patients for Inclusion in Clinical Trials**

- The appropriateness of pursuing an indication in a molecular subset of a disease depends on the strength of evidence supporting the hypothesis that patients with the molecular alteration of interest will be more likely to respond to the targeted therapy owing to some property of the drug (e.g., based on a putative mechanism of action or previous clinical experience with the drug) than patients without the molecular alteration.
- If a sponsor is pursuing an enrichment strategy based on molecular criteria for the purposes of clinical trial design and eligibility, the FDA will accept grouping patients with different molecular alterations if it is reasonable to expect that the grouped patients will have similar pharmacological responses based on a strong scientific rationale.<sup>5</sup> The rationale for grouping patients can be based on computational (e.g., in silico), experimental (e.g., in vitro or animal experiments), or clinical evidence. Sponsors should discuss any proposed grouping strategy with the FDA.
- Types of evidence that could support a grouping strategy are listed below in general order of decreasing strength, although other sources of evidence may also be appropriate. When more than one of these observations are present, the strength of the evidence increases.
  - **Clinical studies:** Preliminary studies demonstrate patients with the proposed group of specific molecular alterations exhibit similar responses to the investigational drug based on a clinical efficacy endpoint or pharmacodynamic (PD) biomarker.

---

<sup>4</sup> For the purpose of this guidance, *low-frequency* molecular alterations are those that occur at frequencies low enough that enrolling a sufficient number of patients to conduct a clinical trial limited to the specific molecular alteration of interest is not feasible or practical.

<sup>5</sup> For further discussion on clinical trial enrichment strategies, refer to the draft guidance for industry *Enrichment Strategies for Clinical Trials to Support Approval of Human Drugs and Biological Products*. When final, this guidance will represent the FDA’s current thinking on this topic. For the most recent version of a guidance, check the FDA Drugs guidance web page at <https://www.fda.gov/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/default.htm>.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

- 70 – **Nonclinical studies:** Consistent drug effects are observed across a model system  
71 with the proposed group of molecular alterations in nonclinical studies.  
72
- 73 – **In silico or mechanism-based evidence:** The investigational drug is expected to  
74 have a consistent effect across patients with the proposed group of molecular  
75 alterations based on computational studies or mechanistic rationale (e.g., all protein  
76 truncating mutations or over-expression of the drug target in tumor tissue).  
77
- 78 – **Evidence from other drugs in the same pharmacological class:** Drugs with a  
79 mechanism of action similar to the drug under investigation show consistent effects  
80 across the proposed group of molecular alterations in a nonclinical model or clinical  
81 trials.  
82
- 83 – **Phenotypic characterization of molecular alterations:** The proposed group of  
84 molecular alterations shows consistent effects on relevant disease-related nonclinical  
85 or clinical phenotypes (e.g., mutations that result in increased activity of the drug  
86 target).  
87
- 88 • Sponsors should use analytically validated assays for the identification of molecular  
89 alterations used for enrollment of patients into clinical trials.<sup>6</sup> The FDA recognizes that  
90 the clinical trial assay method may limit who is eligible for clinical trials. Ideally,  
91 clinical trial assays should be designed to detect all possible molecular alterations that  
92 comprise the group that is expected to respond (e.g., as detected through next-generation  
93 sequencing).  
94

### **B. Generalizability of Findings**

- 95
- 96
- 97 • Targeted therapies may be effective in multiple molecular subsets that make up a clinical  
98 disease. However, the FDA anticipates that for certain subsets only a small number of  
99 patients (or even none despite eligibility criteria that are inclusive of such patients) will  
100 be enrolled into the trial. The low numbers or the absence of such patients would in most  
101 settings preclude meaningful empirical inferences about treatment benefits or risks in  
102 patients with those particular molecular alterations. However, when sponsors follow the  
103 principles for grouping patients set out in section II.A., Identification of Patients for  
104 Inclusion in Clinical Trials, extrapolation across multiple subsets may be possible despite  
105 the low frequency or absence of patients in some subsets.  
106
- 107 • Given the above considerations, if the clinical trials are successful and other conditions  
108 for approval are met, the FDA will, in most circumstances, approve the drug for all  
109 patients who meet the inclusion criteria for the trial based on the prespecified criteria,  
110 irrespective of the extent to which patients with various molecular alterations were  
111 represented in the clinical trial. Substantial evidence of effectiveness for the drug in the

---

<sup>6</sup> For additional information, see the draft guidance for industry and FDA staff *Principles for Codevelopment of an In Vitro Companion Diagnostic Device with a Therapeutic Product*. When final, this guidance will represent the FDA's current thinking on this topic. For the most recent version of a guidance, check the FDA Drugs guidance web page at <https://www.fda.gov/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/default.htm>.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

112 indicated population would be based on the strength of evidence (see section II.A.,  
113 Identification of Patients for Inclusion in Clinical Trials) demonstrating that patients in  
114 the molecular grouping defined by the inclusion criteria will respond similarly to the  
115 patients who participated in the study. As with all new drug approvals, the FDA will  
116 consider the totality of evidence in weighing the benefits and risks of the drug. If after  
117 trial enrollment the FDA or sponsor newly identifies a substantial scientific issue  
118 essential to determining the safety or effectiveness of the drug in some molecular subset  
119 included in the trial, the indicated patient population may be narrower than the clinical  
120 trial enrollment criteria.

### **C. Benefit and Risk Determination and Labeling**

- 124 • Labeling will reflect the overall benefits and risks of the drug in the target population.  
125 When the drug is approved for all patients who meet the inclusion criteria for the  
126 registration trials as discussed in section II.B., Generalizability of Findings, the  
127 INDICATIONS AND USAGE statements should be sufficiently broad to include  
128 treatment of patients with low-frequency molecular alterations who would have been  
129 eligible for the trial irrespective of the extent to which they were represented in clinical  
130 trials. The studies informing the basis for grouping patients (e.g., cell or animal models,  
131 PD data) should be clearly specified (e.g., under CLINICAL PHARMACOLOGY or  
132 CLINICAL STUDIES).
- 134 • Evidence supporting the efficacy of the drug for each molecular subset should be  
135 transparently displayed (e.g., tabulation of the number of cases with specific molecular  
136 alterations that were enrolled in the clinical trial and the outcomes of the cases) under  
137 CLINICAL STUDIES.
- 139 • When accurate testing for molecular alterations (whether as a class or as specific  
140 alterations) is essential for the safe and effective use of the drug, an FDA-cleared  
141 or -approved assay should be commercially available at the time of drug approval to  
142 identify patients in the clinical setting. The FDA may grant exceptions when the drug is  
143 intended to treat a serious or life-threatening condition for which no satisfactory  
144 alternative treatment exists, and FDA determines that the benefits from the use of the  
145 drug outweigh the risks from the lack of an approved or cleared in vitro companion  
146 diagnostic device.<sup>7</sup>

### **D. Refining the Target Population/Indication After Initial Approval**

- 150 • Incremental expansion of the population eligible for a drug may be part of a lifecycle  
151 strategy. The amount and nature of clinical efficacy data needed to expand a drug's  
152 indication depends on the similarity of pharmacologic responses and the mechanistic  
153 rationale for the drug's effect in the population for which efficacy was initially  
154 established and in the population to which the indication is being expanded. Similarly, if  
155 emerging data from studies (whether observational or randomized trials) indicates lack of

---

<sup>7</sup> For additional information, see the guidance for industry and FDA staff *In Vitro Companion Diagnostic Devices*.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

156 efficacy in certain molecular subgroups for which the drug was initially indicated, then,  
157 the FDA will consider narrowing the intended population.

158

- 159 • In some cases, generating data in the postmarket setting may be necessary to provide  
160 additional information regarding the risks and benefits of the drug in subsets of patients  
161 with limited or no enrollment in clinical trials. Real world evidence (e.g., from  
162 observational studies or registry data), traditional controlled trials, or data from other  
163 sources may be appropriate. As with all drug development programs, if the FDA  
164 approves the drug under the accelerated approval program<sup>8</sup> or identifies safety concerns  
165 during the review process, the FDA may require postmarketing studies.
