# Electronic Systems, Electronic Records, and Electronic Signatures in Clinical Investigations Questions and Answers Guidance for Industry

## ***DRAFT GUIDANCE***

**This guidance document is being distributed for comment purposes only.**

Comments and suggestions regarding this draft document should be submitted within 60 days of publication in the *Federal Register* of the notice announcing the availability of the draft guidance. Submit electronic comments to <https://www.regulations.gov>. Submit written comments to the Dockets Management Staff (HFA-305), Food and Drug Administration, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852. All comments should be identified with the docket number listed in the notice of availability that publishes in the *Federal Register*.

For questions regarding this draft document, contact (CDER) Elizabeth Kunkoski, [elizabeth.kunkoski@fda.hhs.gov](mailto:elizabeth.kunkoski@fda.hhs.gov) or 301-796-6439; (CBER) Office of Communication, Outreach and Development, 800-835-4709 or 240-402-8010; (CDRH) Office of Clinical Evidence and Analysis, [CDRHClinicalEvidence@fda.hhs.gov](mailto:CDRHClinicalEvidence@fda.hhs.gov); (CFSAN) [yuguang.wang@fda.hhs.gov](mailto:yuguang.wang@fda.hhs.gov) or 240-402-1757; (CTP) [ctp-bimo@fda.hhs.gov](mailto:ctp-bimo@fda.hhs.gov); or (CVM) Eric Nelson [eric.nelson@fda.hhs.gov](mailto:eric.nelson@fda.hhs.gov) or 240-402-5642.

4 **Guidance for Industry<sup>1</sup>**  
5

6  
7 This draft guidance, when finalized, will represent the current thinking of the Food and Drug  
8 Administration (FDA or Agency) on this topic. It does not establish any rights for any person and is not  
9 binding on FDA or the public. You can use an alternative approach if it satisfies the requirements of the  
10 applicable statutes and regulations. To discuss an alternative approach, contact the FDA staff responsible  
11 for this guidance as listed on the title page.  
12

13  
14  
15  
16 **I. INTRODUCTION**  
17

18 This document provides guidance to sponsors, clinical investigators, institutional review boards  
19 (IRBs), contract research organizations (CROs),<sup>2</sup> and other interested parties on the use of  
20 **electronic systems**,<sup>3</sup> **electronic records**, and **electronic signatures** in clinical investigations<sup>4</sup> of  
21 medical products,<sup>5</sup> foods, tobacco products,<sup>6</sup> and new animal drugs.<sup>7</sup> The guidance provides  
22 recommendations regarding the requirements, including the requirements under 21 CFR part 11  
23 (part 11), under which FDA considers electronic systems, electronic records, and electronic

---

<sup>1</sup> This guidance has been prepared by the Office of Medical Policy in the Center for Drug Evaluation and Research (CDER) in coordination with the Center for Biologics Evaluation and Research (CBER), the Center for Devices and Radiological Health (CDRH), the Center for Food Safety and Applied Nutrition (CFSAN), the Center for Tobacco Products (CTP), the Center for Veterinary Medicine (CVM), the Office of Regulatory Affairs (ORA), and the Office of Clinical Policy (OCLiP) at the Food and Drug Administration.

<sup>2</sup> In some clinical investigations, a sponsor may transfer responsibility for any or all of its obligations under 21 CFR part 312 to a CRO (21 CFR 312.52). The requirements and recommendations that apply to sponsors throughout this guidance would also apply to CROs to the extent they have accepted responsibility for the sponsor's obligations.

<sup>3</sup> Words and phrases in **bold italics** are defined in the Glossary.

<sup>4</sup> For FDA's regulatory definitions of *clinical investigation* or *investigation*, see, e.g., 21 CFR 50.3(c), 56.102(c), 312.3(b), and 812.3(h). In this guidance, the terms *clinical trial*, *trial*, *clinical study*, *study*, *clinical investigation*, and *investigation* are interchangeable.

<sup>5</sup> In this guidance, the term *medical products* refers to human drugs and medical devices, including those that are licensed as biological products.

<sup>6</sup> Part 11 requirements only apply to records required under predicate rules; therefore, part 11 requirements do not apply to a request to use an investigational tobacco product at this time. However, we encourage sponsors, clinical investigators, and other interested parties to review this guidance for recommendations related to the use of electronic systems, electronic records, and electronic signatures in clinical investigations.

<sup>7</sup> See 21 CFR 11.1(b).

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

24 signatures to be trustworthy, reliable, and generally equivalent to paper records and handwritten  
25 signatures executed on paper.

26  
27 This guidance revises the draft guidance for industry *Use of Electronic Records and Electronic*  
28 *Signatures in Clinical Investigations Under 21 CFR Part 11 — Questions and Answers* (June  
29 2017).<sup>8</sup> This guidance expands upon recommendations in the guidance for industry *Part 11,*  
30 *Electronic Records; Electronic Signatures — Scope and Application* (August 2003) (2003 part  
31 11 guidance) that pertain to clinical investigations conducted under 21 CFR parts 312 and 812.  
32 When finalized, this guidance will supersede the guidance for industry *Computerized Systems*  
33 *Used in Clinical Investigations* (May 2007). Other related guidances are included in the  
34 Appendix.

35  
36 In general, FDA’s guidance documents do not establish legally enforceable  
37 responsibilities. Instead, guidances describe the Agency’s current thinking on a topic and should  
38 be viewed only as recommendations, unless specific regulatory or statutory requirements are  
39 cited. The use of the word *should* in Agency guidances means that something is suggested or  
40 recommended, but not required.

41

42

## 43 **II. BACKGROUND**

44

45 In March 1997, FDA published a final rule to establish criteria that generally must be met when a  
46 record required by a predicate rule<sup>9</sup> is created, modified, maintained, archived, retrieved, or  
47 transmitted in electronic form in place of a paper record and when electronic signatures are used  
48 in place of traditional handwritten signatures.<sup>10</sup> FDA considers electronic records to be  
49 equivalent to paper records and considers electronic signatures to be equivalent to traditional  
50 handwritten signatures when they meet the requirements under part 11,<sup>11</sup> subject to program-  
51 specific rules for electronic records and signatures.<sup>12</sup>

52

53 In August 2003, FDA issued the 2003 part 11 guidance. The 2003 part 11 guidance provided  
54 recommendations that were narrowly tailored to reflect the technological environment that  
55 prevailed at that time. FDA continues to apply a narrow and practical interpretation of the part  
56 11 regulations as described in the 2003 part 11 guidance. FDA reminds sponsors and other

---

<sup>8</sup> When final, this guidance will represent FDA’s current thinking on this topic. For the most recent version of a guidance, check the FDA guidance web page at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents>.

<sup>9</sup> The underlying requirements set forth in the Federal Food, Drug, and Cosmetic Act (FD&C Act), the Public Health Service Act (PHS Act), and FDA regulations (other than part 11) are referred to in this guidance as *predicate rules*. See 21 CFR 11.1.

<sup>10</sup> See § 11.1 and 62 FR 13430 (March 20, 1997).

<sup>11</sup> See § 11.1(a).

<sup>12</sup> Note that the 2003 part 11 guidance was prepared and issued by CFSAN, CVM, ORA, CDER, CDRH, and CBER. CTP continues to consider the relevance of the recommendations and policies in the 2003 part 11 guidance to tobacco product submissions.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

57 regulated entities, however, that electronic records must still be maintained or submitted in  
58 accordance with the underlying predicate rules, and the Agency can take regulatory action for  
59 noncompliance with such predicate rules.

60  
61 FDA recognizes that since 2003, advances in technology have expanded the uses and capabilities  
62 of electronic systems in clinical investigations. In addition, electronic systems and technologies  
63 are used and managed in novel ways, services are shared or contracted between organizations,  
64 and the electronic data flow between systems is more efficient and more prevalent. The  
65 capabilities of electronic systems have improved, and features such as automated date and time  
66 stamps, ***audit trails***, and the ability to generate complete and accurate copies and to archive  
67 records are standard components of many electronic systems. Understanding the evolving uses  
68 of electronic records, electronic systems, and electronic signatures in clinical investigations is  
69 important for FDA in its assessment of the authenticity, integrity, and reliability of data  
70 submitted in support of marketing applications or submissions.

71  
72 Accordingly, this guidance provides additional recommendations regarding the risk-based  
73 approach to ***validation*** described in the 2003 part 11 guidance to continue to ensure the  
74 authenticity, integrity, and confidentiality of electronic data and records for clinical  
75 investigations during their creation, modification, maintenance, archival, retrieval, and  
76 transmission.<sup>13</sup>

77  
78 This guidance also addresses the applicability of part 11 requirements for electronic systems and  
79 ***information technology (IT) services*** used to create, modify, maintain, archive, retrieve, or  
80 transmit an electronic record as well as for the use of ***digital health technology (DHT)*** to  
81 remotely acquire data in a clinical investigation.

82  
83

### **III. QUESTIONS AND ANSWERS**

84  
85

86 Good clinical practice (GCP) is an international ethical and scientific standard for designing,  
87 conducting, recording, and reporting clinical investigations that involve the participation of  
88 human or animal subjects.<sup>14</sup> Compliance with FDA's GCP regulations provides public  
89 assurance that the rights, safety, and welfare of subjects are protected and that the clinical  
90 investigation data are credible.<sup>15,16</sup> The appropriate use of electronic records is an important  
91 component of GCP, and part 11 regulations help ensure that the electronic records and data for a  
92 clinical investigation are trustworthy and reliable.

93

---

<sup>13</sup> For more information, see the 2003 part 11 guidance. See also footnote 9.

<sup>14</sup> See the International Council for Harmonisation (ICH) guidance for industry *E6(R2) Good Clinical Practice: Integrated Addendum to ICH E6(R1)* (March 2018).

<sup>15</sup> See, e.g., 21 CFR parts 11, 16, 50, 54, 56, 58, 312, 314, 320, 511, 514, 601, 812, and 814.

<sup>16</sup> See the ICH guidance for industry *E6(R2) Good Clinical Practice: Integrated Addendum to ICH E6(R1)*.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

### 94           **A.       Electronic Records**

95  
96       Electronic records used in clinical investigations that fall under the scope of part 11 requirements  
97       include:

- 98  
99           •       Records needed for FDA to reconstruct a clinical investigation that are maintained and  
100           archived under predicate rules in electronic format in place of paper format or where the  
101           electronic record is relied on to perform regulated activities<sup>17</sup>  
102  
103           •       Records submitted to FDA in electronic format under predicate rules, even if such  
104           records are not specifically identified in FDA regulations<sup>18</sup>  
105

### 106       **Q1.    Are electronic records from real-world data sources submitted to FDA as part of a** 107       **marketing application or under other predicate rules subject to part 11** 108       **requirements?**

109  
110       Yes. 21 CFR part 11 requirements apply to electronic records from ***real-world data (RWD)***  
111       sources that were created, modified, maintained, archived, retrieved, or transmitted under any  
112       records requirements set forth in FDA regulations or submitted to the Agency under  
113       requirements of the Federal Food, Drug, and Cosmetic Act (FD&C Act) or the Public Health  
114       Service Act (PHS Act), even if such records are not specifically identified in FDA regulations.<sup>19</sup>  
115       FDA acknowledges that there may be instances when electronic records from RWD sources  
116       were not originally created in part 11-compliant systems with the intention of being submitted to  
117       FDA as part of a marketing application, but such records can be used for that purpose. Sponsors  
118       that intend to rely on such data in support of a marketing application should ensure the quality  
119       and integrity of such electronic records.<sup>20</sup>  
120

---

<sup>17</sup> See § 11.1(b). For examples of relevant predicate rules, see 21 CFR 312.57, 312.58, and 312.62 (for drug and biological product investigational new drug applications (INDs)) and 21 CFR 812.28 and 812.140 (for investigational device exemptions (IDEs)).

<sup>18</sup> See § 11.1(b).

<sup>19</sup> See §§ 11.1(b), 314.50, and 601.2.

<sup>20</sup> As stated in the guidance for industry *Use of Electronic Health Records Data in Clinical Investigations* (July 2018) (2018 guidance), FDA does not intend to assess compliance of an ***electronic health record (EHR) system*** with part 11 regulations because, in general, they are under the control of organizations not regulated by FDA (e.g., health care providers, health care organizations, and health care institutions). These electronic systems provide electronic records (e.g., hospital admission records, pharmacy records, laboratory records, imaging records) during the course of patients' care that may be useful in clinical investigations. As noted above, FDA's acceptance of data in support of a marketing application or submission depends on FDA's ability to verify the quality and integrity of the data during FDA inspections (see 21 CFR parts 312 and 812). Note that the 2018 guidance was prepared and issued by CBER, CDER, and CDRH. CTP continues to consider the relevance of the recommendations and policies of the 2018 guidance to tobacco product submissions.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

121 **Q2. If a sponsor is conducting a clinical investigation with a non-U.S. (foreign) site, are**  
122 **the electronic records submitted to FDA as part of a marketing application or under**  
123 **other predicate rules subject to part 11 requirements?**  
124

125 If a sponsor is conducting a clinical investigation with a non-U.S. site, part 11 requirements  
126 generally apply to records in electronic form that are required under predicate rules,<sup>21</sup> including  
127 electronic records submitted to FDA in support of a marketing application or other submission.  
128

129 For any data submitted in support of a marketing application or other submission, FDA  
130 recommends that sponsors ensure electronic records used in clinical investigations are credible  
131 and accurate. For example, the quality of data collected at foreign sites during clinical  
132 investigations that are not conducted under an IND,<sup>22</sup> IDE,<sup>23</sup> or investigational new animal drug  
133 file (INAD)<sup>24</sup> or that are submitted to FDA in support of a marketing application or submission  
134 should be equivalent to the quality of data collected under an IND, IDE, or INAD.<sup>25</sup> Namely, for  
135 sponsors to rely on such data in support of a human drug marketing application or submission,  
136 sponsors must ensure electronic records used in the clinical investigation are credible and  
137 accurate.<sup>26</sup>  
138

139 **Q3. Should sponsors, clinical investigators, and other regulated entities maintain and**  
140 **retain a certified copy of clinical investigation electronic records?**  
141

142 If a sponsor, clinical investigator, or other regulated entity intends to maintain and retain a copy  
143 of an electronic record required for the clinical investigation in place of an original paper or  
144 original electronic record, the copy maintained and retained should be a ***certified copy***. A  
145 certified copy is a copy (irrespective of the type of media used) of the original record that has  
146 been verified (i.e., by a dated signature or by generation through a validated process) to have the  
147 same information, including data that describe the context, content, and structure, as the  
148 original.<sup>27</sup> For example, for conversion between paper and electronic records, sponsors should  
149 rely on validated processes (e.g., scanning or printing) to generate certified paper or electronic  
150 copies. The copy generated by the validated process that is maintained and retained in place of

---

<sup>21</sup> See, e.g., §§ 11.1(b), 314.50, 514.1, 601.2, and 814.20. But see 21 CFR 11.1(f) through (p).

<sup>22</sup> For more information about foreign clinical studies supporting drug applications that are not conducted under an IND, see § 312.120. Marketing approval of a new drug based solely on foreign clinical data is governed by § 314.106.

<sup>23</sup> For more information about foreign clinical data supporting IDE or device marketing applications or submissions, see § 812.28 as well as the guidance for industry and FDA staff *Acceptance of Clinical Data to Support Medical Device Applications and Submissions: Frequently Asked Questions* (February 2018).

<sup>24</sup> For more information about foreign clinical studies supporting new animal drug applications or submissions, see the guidance for industry *Use of Data from Foreign Investigational Studies to Support Effectiveness of New Animal Drugs* (October 2021).

<sup>25</sup> See § 312.120 (for further information on the requirements for foreign clinical studies not conducted under an IND to support an IND or application for marketing approval).

<sup>26</sup> See, e.g., § 312.120.

<sup>27</sup> See the ICH guidance for industry *E6(R2) Good Clinical Practice: Integrated Addendum to ICH E6(R1)*.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

151 the original record should include the date and time when it was created. Sponsors, clinical  
152 investigators, and other regulated entities should have written standard operating procedures  
153 (SOPs) to ensure consistency in the certification process.

154  
155 When providing certified electronic or paper copies of electronic records, the associated  
156 **metadata** should be included, such as units of the data (e.g., mg); a date and time stamp for when  
157 the data were acquired; and the individual responsible for creating the copy, size of file, and  
158 number of files. Additional metadata are important for establishing authenticity or integrity for  
159 certain record types, such as digital photographs and audiovisual files.

160  
161 **Q4. Is FDA recommending that electronic records from medical service providers not**  
162 **involved in the clinical investigation be certified?**

163  
164 No. FDA’s recommendation to maintain and retain certified copies of electronic records does  
165 not extend to electronic copies of records from medical service providers such as hospitals,  
166 laboratories, or health care practitioners not involved in the clinical investigation (e.g., copies of  
167 paper health records or EHRs containing a potential participant’s medical history to a clinical  
168 investigator used either to determine eligibility for the clinical investigation or to report  
169 treatment for an adverse event). The clinical investigator should retain documentation that  
170 indicates the source of the records (e.g., cover sheet sent by the hospital).

171  
172 **Q5. How should sponsors, clinical investigators, and other regulated entities retain**  
173 **electronic records from a clinical investigation?**

174  
175 There are various ways to retain electronic records, including in durable electronic storage  
176 devices and using **cloud computing** services.<sup>28</sup> Sponsors, clinical investigators, and other  
177 regulated entities must ensure the authenticity, integrity, and confidentiality of the data from the  
178 point of creation and also ensure that the meaning of the record is preserved.<sup>29</sup> The relationship  
179 between records, **source data**, and all associated metadata should be preserved in a secure and  
180 traceable manner.

181  
182 FDA’s expectation is that sponsors, clinical investigators, and other regulated entities will ensure  
183 that records are maintained throughout the records’ retention period per applicable regulations<sup>30</sup>  
184 and, as applicable, made available to FDA during an inspection.<sup>31</sup> When electronic formats are  
185 the only formats used to create, preserve, and archive electronic records, sufficient backup and  
186 recovery procedures should be in place to protect against data loss. For example, records should  
187 be backed up regularly to prevent loss. Backup records should be stored in a secure electronic  
188 location independent from the original records as specified in an SOP. Backup and recovery logs  
189 should be maintained to facilitate an assessment of the nature and scope of data loss resulting  
190 from a system failure.

---

<sup>28</sup> See also section III.C for considerations when using IT service providers who provide cloud computing services.

<sup>29</sup> See § 11.30.

<sup>30</sup> See §§ 56.115(b), 312.57, 312.62, 511.1(b)(7)(ii), 511.1(b)(8)(i), and 812.140(d).

<sup>31</sup> See §§ 56.115(b), 312.58, 312.68, 511.1(b)(8)(i), and 812.145.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

191  
192 As part of an inspection, sponsors, clinical investigators, and other regulated entities may be  
193 requested to provide all records and data needed to reconstruct a clinical investigation, including  
194 associated metadata and audit trails.<sup>32</sup> FDA may request copies of these records and data in a  
195 human-readable form. Screenshots or paper printouts of electronic records should include  
196 metadata and audit trail information recorded in the electronic system. When systems are  
197 decommissioned and cannot be recommissioned, sponsors should ensure that files containing the  
198 metadata are retained before decommissioning and can be linked to each corresponding ***data***  
199 ***element***.

200  
201 **Q6. Are electronic communication methods (e.g., email systems or text messages) for**  
202 **transmitting electronic records addressed by 21 CFR part 11?**  
203  
204 Part 11 regulations do not address electronic communication methods used in the transmission of  
205 electronic records. When electronic records required by a predicate rule are transmitted via an  
206 electronic communication method, the regulated entity should ensure secure end-to-end transfer  
207 of that record. Audit trails in the sponsor’s electronic system should capture the date and time  
208 that electronic records are transferred and the originator of those records.

209  
210 **B. Electronic Systems Owned or Controlled by Sponsors or Other Regulated**  
211 **Entities**

212  
213 This section describes recommendations for electronic systems that are owned or controlled by  
214 sponsors or other regulated entities and are used by such regulated entities to produce required  
215 records in clinical investigations.

216  
217 Examples of these electronic systems can include:

- 218
- 219 • ***Electronic case report forms (eCRFs)*** and ***electronic data capture (EDC) systems***,  
220 including EDC systems that capture source data directly into eCRFs
  - 221
  - 222 • Electronic trial master files (eTMFs)
  - 223
  - 224 • Electronic clinical data management systems (eCDMS)
  - 225
  - 226 • Electronic clinical trial management systems (eCTMS)
  - 227
  - 228 • Electronic quality management systems
  - 229
  - 230 • Interactive response technology (IRT) systems
  - 231
    - 232 – Interactive voice response system (IVRS)
    - 233
    - 234 – Interactive web response system (IWRS)

---

<sup>32</sup> See §§ 312.58, 312.68, 511.1(b)(8)(i), 812.140, and 812.145.

## Contains Nonbinding Recommendations

- 243
- Adverse event reporting (AER) and processing systems
- 244
- 245

246 **Q7. What should be considered when using a risk-based approach for validation of**

247 **electronic systems used in clinical investigations?**

248

249 The 2003 part 11 guidance, which states that FDA intends to exercise enforcement discretion

250 regarding specific part 11 requirements for validation of computerized systems (§§ 11.10(a) and

251 corresponding requirements in 11.30), recommends that industry base its approach to such

252 validation on a justified and documented risk assessment and a determination of the potential of

253 the system to affect product quality and safety as well as record integrity.<sup>33</sup> Accordingly, we

254 recommend that sponsors and other regulated entities use a risk-based approach<sup>34</sup> for validating

255 electronic systems owned or managed by sponsors and other regulated entities.

256

257 For purposes of this guidance, validation means a process of establishing and documenting that

258 the specified requirements of an electronic system can be consistently fulfilled from design until

259 decommissioning of the system or transitioning to a new system.<sup>35</sup> Validation ensures that the

260 electronic system is correctly performing its intended function.

261

262 Considerations when applying a risk-based approach for validation of electronic systems include

263 the following:

264

- The purpose and significance of the record and the criticality of the data (e.g., how the record and data will be used to support the regulatory decision and/or ensure participant safety).
- The intended use of the electronic system (e.g., used to process records<sup>36</sup> that are essential to the clinical investigation). Validation is critical for electronic systems that

---

<sup>33</sup> See the 2003 part 11 guidance.

<sup>34</sup> This guidance does not provide comprehensive detail on how to perform a risk assessment. There are many risk assessment methodologies and tools from a variety of industries that can be applied. For more information, see the ICH guidance for industry *Q9(R1) Quality Risk Management* (June 2022). Also, see the International Organization for Standardization's (ISO's) standard ISO 31010:2019 Risk management – Risk assessment techniques.

<sup>35</sup> See the ICH guidance for industry *E6(R2) Good Clinical Practice: Integrated Addendum to ICH E6(R1)*.

<sup>36</sup> In this guidance, *to process records* includes actions such as creating, modifying, maintaining, archiving, retrieving, or transmitting.

## Contains Nonbinding Recommendations

Draft — Not for Implementation

271 are used for activities such as data integration, data analysis, adverse event recording or  
272 processing, endpoint evaluation, medical product dispensation, administration, and  
273 accountability.

- 274
- 275 • The nature of the electronic system (e.g., *commercial off-the-shelf (COTS) system,*  
276 *customized electronic system*).
  - 277
  - 278 – For COTS office utility software, such as word processing, spreadsheet, and PDF  
279 tools, the extent of validation should be guided by the organization’s internal business  
280 practices and the intended use of the software in the clinical investigation. Generally,  
281 validation should not be necessary for COTS office utility software used as intended  
282 by the manufacturer.
  - 283
  - 284 – For new electronic systems that are custom-made or for existing systems that are  
285 customized (e.g., IRT system or eCRF system designed to meet the requirements of  
286 the protocol), sponsors should review the *vendor’s* SOPs, the system and software  
287 development life cycle model, validation documentation, change control procedures,  
288 and change control tracking logs. In addition, sponsors should perform *user*  
289 *acceptance testing (UAT)* and document the criteria for and results of testing to  
290 ensure that the electronic system fulfills its intended purpose. Alternatively, sponsors  
291 should review the vendor’s UAT and document that the UAT was reviewed and was  
292 found to be adequate.

293

294 Changes to electronic systems (including software upgrades, security and performance patches,  
295 equipment or component replacements, and new instrumentation) should be evaluated and  
296 validated depending on risk. They should not affect the collection, storage, and retrieval of  
297 existing or new records or the traceability, authenticity, and integrity of existing data. Changes  
298 that affect operational limits or design specifications should be validated. Finally, all changes to  
299 the system should be documented. It may be appropriate for FDA to request documentation of  
300 system validation during an FDA inspection.

301

302 **Q8. What documentation should the sponsor have in place for electronic systems that**  
303 **fall under the scope of part 11, and what will be FDA’s focus during inspections of**  
304 **the sponsor?**

305

306 For each clinical investigation protocol, the sponsor should describe the electronic systems (e.g.,  
307 IRT system, EDC, eCOA) used to collect clinical investigation data as well as the electronic  
308 systems used to create, modify, maintain, archive, retrieve, or transmit pertinent electronic  
309 records. Sponsors should create a diagram that depicts the flow of data from creation to final  
310 storage.

311

312 Consistent with a risk-based approach to validation (see Q7), sponsors should consider (1) the  
313 purpose and significance of the record and the criticality of the data, (2) the intended use of the  
314 electronic system, and (3) the nature of the electronic system to determine when documentation  
315 or SOPs addressing the following are appropriate:

316

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

- 317 • System setup, installation, and maintenance
- 318
- 319 • System validation (e.g., validation plans, execution, and reports)
- 320
- 321 • UAT performed by the sponsor or vendor
- 322
- 323 • Change control procedures and change control
- 324
- 325 • System account setup and management, including user access controls
- 326
- 327 • Data backup, recovery, and contingency plans
- 328
- 329 • Alternative data entry methods (in the case of system unavailability)
- 330
- 331 • Information pertinent to use of the electronic system (e.g., audit trail information,
- 332 interoperable data standards)
- 333
- 334 • Support mechanisms in place, such as training (including training records) and technical
- 335 support
- 336
- 337 • Internal and external **audits** of electronic systems and of vendors that are performed or
- 338 provided by the sponsor or independent consultants (see Q10) to ensure that the system is
- 339 functioning and is being used consistently as intended
- 340
- 341 • Roles and responsibilities of sponsors, clinical sites, and other parties with respect to the
- 342 use of electronic systems in the clinical investigation
- 343

344 Documentation related to the bulleted list above should be retained as part of the clinical  
345 investigation records and be available for inspection by FDA in order to assess whether such  
346 records contain information bearing on the sponsors' adequate compliance with relevant  
347 requirements. For electronic systems that fall under the scope of part 11, FDA will generally  
348 focus on the following during a sponsor inspection:

- 350 • Data collection, data handling, and data management plans and procedures
- 351
- 352 • The life cycle of the electronic system, from design and implementation to
- 353 decommissioning or transitioning to a new system
- 354
- 355 • Processes and procedures that are in place to ensure that the data and records required to
- 356 reconstruct the clinical investigation are not altered in value or meaning
- 357
- 358 • Authority checks in the electronic systems to ensure only authorized individuals are given
- 359 appropriate access
- 360
- 361 • Change control procedures and any changes made to the system once in use

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

- 362
- 363       • Any contracts with vendors or other delegated entities that detail their functions and
- 364       responsibilities
- 365
- 366       • All corrective and preventive actions implemented across all relevant activities and
- 367       systems
- 368

369 **Q9. What documentation should be available at clinical investigator sites for electronic**

370 **systems that fall under the scope of part 11, and what will be FDA’s focus during**

371 **inspections of clinical investigator sites?**

372

373 Sponsors should provide information to clinical investigator sites regarding electronic systems

374 used in the clinical investigation that are owned or controlled by sponsors and vendors and that

375 fall under the scope of part 11. This information may include policies and procedures related to

376 system account setup and management, access controls and user access privileges, system user

377 manuals, and system training materials and records. The clinical investigator should retain this

378 information for review during an FDA inspection so that FDA can assess whether such records

379 contain information bearing on the sponsor’s adequate compliance with relevant requirements.

380

381 Clinical investigator sites that own or control electronic systems used in the clinical investigation

382 that fall under the scope of part 11 (e.g., site-owned EDC system, electronic clinical investigator

383 site file) should retain the documentation related to the use of the electronic systems as described

384 in Q8.

385

386 Clinical investigator sites may have their own SOPs and documentation pertinent to the use of

387 electronic systems. Such information may include, for example, SOPs that ensure users at the

388 clinical investigator sites have their own accounts and appropriate access; SOPs for notifying

389 sponsors of changes in clinical investigation personnel at the site so that access rights can be

390 terminated; backup, recovery, and contingency plans for source documentation retained at the

391 site; and site-generated user training. Clinical investigator sites should retain this information for

392 review during an FDA inspection.

393

394 FDA will generally focus on the following during a clinical investigator site inspection:

395

- 396       • Records related to staff training on the use of electronic systems<sup>37</sup>
- 397
- 398       • Procedures and controls in place for system access, data creation, data modification, and
- 399       data maintenance<sup>38</sup>
- 400
- 401       • Use of electronic systems at the clinical investigator site to generate, collect, transmit,
- 402       and archive data<sup>39</sup>

---

<sup>37</sup> See § 11.10(i).

<sup>38</sup> See §§ 11.10(d) and (k).

<sup>39</sup> See § 11.10.

**Q10. During an inspection, will FDA review the reports of audits performed by sponsors or other regulated entities of IT service providers' electronic systems, products, and services?**

Sponsors and other regulated entities often conduct audits to assess the *IT service provider's* quality management plan and the content of and compliance with relevant SOPs used in the design and development of the electronic system, product, or service. Sponsors and other regulated entities also often conduct audits of clinical investigation data in electronic systems to ensure the functionality of the system.

FDA will generally not review audit reports of the IT service provider's electronic systems, products, and services.<sup>40</sup>

**Q11. What are FDA's requirements and recommendations regarding the use of security safeguards?**

Sponsors, clinical investigators, and other regulated entities must ensure that procedures and processes are in place to safeguard the authenticity, integrity and, when appropriate, confidentiality of electronic records.<sup>41</sup> Logical and physical access controls should be integral to electronic systems used in clinical investigations to limit system access to authorized users, particularly for systems that provide access to multiple users or systems that are accessed through networks.<sup>42</sup> The selection and application of access controls should be based on an appropriately justified and documented risk-based approach that protects the authenticity, integrity, and confidentiality of the data or information.<sup>43</sup> Part 11 requirements do not specify any particular methods for implementing access controls. Access controls may include multifactor authentication, strong login credentials, and/or *biometrics* (e.g., facial recognition, fingerprints, voice prints, iris scans).

A cumulative record should be maintained of all clinical investigation personnel who are authorized to access the electronic system as well as a description of their access privileges. These records should be accessible for use by appropriate clinical investigation personnel and for inspection by FDA. System administrators should not be involved in data collection or clinical investigation assessments.

---

<sup>40</sup> Compliance policy guide *CPG Sec. 130.300 – FDA Access to Results of Quality Assurance Program Audits and Inspections*, available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/cpg-sec-130300-fda-access-results-quality-assurance-program-audits-and-inspections>.

<sup>41</sup> See §§ 11.10 and 11.30.

<sup>42</sup> See §§ 11.10(d) and 11.30 (for requirements to limit system access to authorized individuals).

<sup>43</sup> Part 11 differentiates electronic systems as closed or open (§§ 11.10 and 11.30) and describes additional measures that may be necessary for open systems. Because of changing technologies and the increased risk of cybersecurity threats, a risk-based approach to validation should be used for all electronic systems.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

438 Individuals should work only under their own usernames and passwords or other access controls  
439 and should not share log-on information with others. Steps must be taken to prevent  
440 unauthorized access to the system.<sup>44</sup> For example, individuals should log off the system when  
441 leaving their workstations. An automatic log off may be appropriate for idle periods. The  
442 system should be designed to limit the number of login attempts and to record unauthorized login  
443 attempts. Processes should be in place to detect, document, report, and remedy security protocol  
444 breaches involving attempted and confirmed unauthorized access.

445  
446 Sponsors should conduct a risk assessment to determine appropriate procedures and controls to  
447 secure data at rest and in transit to prevent access by intervening or malicious parties.

448  
449 Security safeguards (e.g., firewalls; antivirus, anti-malware, and anti-spyware software) should  
450 be in place and continually updated, as appropriate, to prevent, detect, and remedy the effects of  
451 computer viruses; replicating malware computer programs (i.e., worms); and other potentially  
452 harmful software code on clinical investigation data, software, and hardware. Other safeguards,  
453 such as encryption, should be used to ensure confidentiality of the data. In the case of security  
454 breaches to devices or systems, sponsors and other regulated entities should make reasonable  
455 efforts to ensure the continued validity of the source data.<sup>45</sup> Security breaches that could affect  
456 the safety or privacy of clinical investigation participants and data should be reported to the IRB  
457 and FDA as soon as possible.

458

### 459 **Q12. What are considerations for sponsors and other regulated entities when** 460 **implementing audit trails?**

461

462 Audit trails provide a means to verify the quality, authenticity, and integrity of data, allowing  
463 reconstruction of significant details about clinical investigation conduct and source data  
464 collection. Electronically generated, time-stamped audit trails, in addition to other security  
465 measures, can also capture information related to the creation, modification, or deletion of  
466 electronic records.

467

468 Audit trails must capture electronic record activities including all changes made to the electronic  
469 record, the individuals making the changes, the date and time of the changes, and the reasons for  
470 the changes.<sup>46</sup> Original information must not be obscured by the use of audit trails or other  
471 security measures.<sup>47,48</sup> Audit trails should be protected from modification and from being  
472 disabled. Periodic review of the audit trail may be helpful for sponsors to ensure data quality,  
473 authenticity, and integrity. The decision to review audit trails should be based on a risk

---

<sup>44</sup> See § 11.10(d).

<sup>45</sup> Note that this security functionality should be part of the validation process of the software.

<sup>46</sup> See §§ 11.10(e) and 11.30.

<sup>47</sup> Ibid.

<sup>48</sup> See the guidance for industry *Electronic Source Data in Clinical Investigations* (September 2013) (2013 guidance). Note that the 2013 guidance was prepared and issued by CBER, CDER, and CDRH. CTP continues to consider the relevance of the recommendations and policies of the guidance to tobacco product submissions.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

474 assessment of the clinical investigation, taking into account the systems, procedures, and controls  
475 in place.

476  
477 All audit trail information on the creation, modification, and deletion of electronic records must  
478 be available for FDA inspection.<sup>49</sup> A risk-based approach should be applied for retaining access  
479 logs (i.e., records of individuals who accessed the system and the times they did so). For  
480 example, regulated entities should retain all system access logs for electronic systems or files  
481 that contain unblinding information to verify the authenticity and integrity of the blind  
482 throughout the clinical investigation.

483  
484 FDA recommends that the audit trail be retained as a dynamic file (i.e., a file where the audit  
485 trail can be seen in the system while the record is being reviewed). If it is not possible to retain a  
486 dynamic file, the audit trail should be retained as a fixed-data document (e.g., PDF) provided that  
487 the copy of the audit trail information is a certified copy and is clearly linked to the respective  
488 record (see Q3). The audit trail information should accompany all copies of the record,  
489 including those retained by clinical investigators (whether at the clinical investigation site or at  
490 an alternate location). The information should be complete and understandable with clear and  
491 concise terms to describe the components of the audit trail. Audit trail components must include  
492 (1) the date and time the data element or information was entered or modified; (2) the individual  
493 making the change (e.g., user ID and user role); and (3) the old value, new value, and reason for  
494 the change if applicable.<sup>50</sup>

495  
496 In the 2003 part 11 guidance, FDA stated that it intends to exercise enforcement discretion with  
497 respect to specific part 11 requirements, including, but not limited to, computer-generated, time-  
498 stamped audit trails (§§ 11.10(e) and (k)(2) and any corresponding requirement in 11.30).  
499 Persons must still comply with all applicable predicate rules. Even where there are no predicate  
500 rule requirements related to documentation, it is nonetheless important to have audit trails or  
501 other physical, logical, or procedural security measures in place to ensure the trustworthiness and  
502 reliability of the electronic records. FDA recommends basing a decision regarding whether to  
503 apply audit trails or other appropriate measures on the need to comply with predicate rule  
504 requirements, a justified and documented risk assessment, and a determination of the potential  
505 effect on product quality and record integrity.

506  
507 **Q13. Should an audit trail record every key stroke?**

508  
509 It is not necessary to record every key stroke in an audit trail. However, the audit trail should be  
510 available once the user has taken a deliberate action to create, modify, or delete electronic  
511 records. Any edits to completed fields should be captured in the audit trail. If an edit check  
512 exists for submitted data and prompts the user to make a correction, the audit trail should include  
513 the original response, the fact that the edit check prompted a correction, and any change made in  
514 response.

515

---

<sup>49</sup> Audit trail documentation must be retained for a period at least as long as the period required for the subject electronic records and must be available for FDA review and copying (see §§ 11.10(e) and 11.30).

<sup>50</sup> See § 11.10(e).

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

516 **Q14. What controls should be in place to ensure that the electronic system’s date and**  
517 **time are correct?**  
518

519 Controls should be in place to ensure that the system’s date and time are correct. The ability to  
520 change the date or time should be limited to authorized system administrators (see Q11), who  
521 should be notified if a system date or time discrepancy is detected. Any changes to date or time  
522 should be documented, except for automatic time changes made by systems for daylight savings.  
523

524 For electronic systems used in clinical investigations that span different time zones, the sponsor  
525 should indicate the time zone that corresponds to the date and time stamp.  
526

527 **Q15. What are the requirements and recommendations regarding training of individuals**  
528 **who use electronic systems in clinical investigations?**  
529

530 Anyone who develops, maintains, or uses electronic systems subject to part 11 must have the  
531 education, training, and experience necessary to perform their assigned tasks.<sup>51</sup> Relevant  
532 training should be provided to individuals regarding the electronic systems they will use during  
533 the clinical investigation. Training should be conducted before the start of the clinical  
534 investigation and as needed during the study when changes are made to the electronic system.  
535 Training should cover processes and procedures to access the system, to complete clinical  
536 investigation documentation, and to detect and report incorrect data. Training should be  
537 documented. Current training materials should also be available to clinical investigation  
538 personnel and participants during the clinical investigation if needed. See Q8 and Q9 for more  
539 information on retention of training documentation.  
540

541 **Q16. Does FDA provide preliminary evaluations of electronic systems to be used in a**  
542 **clinical investigation to determine whether they comply with part 11 requirements?**  
543

544 No. FDA does not perform preliminary evaluations of electronic systems (e.g., EDC system,  
545 eCTMS) to determine whether they comply with part 11 requirements. These systems will be  
546 evaluated during an inspection.  
547

### **C. Information Technology Service Providers and Services**

548  
549 Sponsors and other regulated entities can contract with vendors to provide IT services for a  
550 clinical investigation (e.g., data hosting, cloud computing software, platform and infrastructure  
551 services). Sponsors and other regulated entities are responsible for ensuring that electronic  
552 records meet applicable part 11 regulatory requirements. When determining the suitability of the  
553 IT service and IT service provider, sponsors and other regulated entities should consider the  
554 following regarding the IT service provider’s ability to ensure the authenticity, integrity, and  
555 confidentiality of clinical investigation records and data:  
556

- 557  
558 • Policies the IT service provider has in place to allow the sponsor to perform oversight of  
559 the clinical investigation functions provided by the IT service provider

---

<sup>51</sup> See § 11.10(i).

- Processes and procedures the IT service provider has in place for validation of specific IT services to be used in the clinical investigation (see Q7)
  - Ability of the IT service provider to generate accurate and complete copies of records and to provide access to data for as long as the records are required to be retained by applicable regulations (see Q5)<sup>52</sup>
  - Processes and procedures the IT service provider has for retaining records and making them available for FDA inspection for as long as the records are required to be retained by applicable regulations (see Q5)<sup>53</sup>
  - Access controls used by the IT service provider for specific IT services used in the clinical investigation, including SOPs for granting and revoking access (see Q11)
  - Ability of the IT service provider to provide secure, computer-generated, time-stamped audit trails of users' actions and changes to data (see Q12)
  - Ability of the IT service provider to secure and protect the confidentiality of data at rest and in transit (as appropriate for the content and nature of the record)
  - Processes and procedures the IT service provider has in place related to electronic signature controls (see section III.E)
  - Relevant experience of the IT service provider

586 **Q17. Should sponsors or other regulated entities establish service level agreements with**

587 **IT service providers?**

588

589 Yes, FDA recommends that sponsors and other regulated entities have written ***service level***

590 ***agreements (SLAs)*** with IT service providers that describe how the IT services will meet the

591 sponsor's requirements. Before entering an agreement, the sponsor or other regulated entity

592 should evaluate and select IT services based on the IT service provider's ability to provide data

593 integrity and data security safeguards (described in the bulleted list in section III.C) that are

594 relevant to the IT service being provided. The SLAs should address services that provide data

595 integrity and data security safeguards, such as participant confidentiality, data reliability, and

596 adherence to applicable regulatory requirements. This should include, but not be limited to, the

597 following:

598

- 599
- 600
- The scope of the work and IT service being provided.

---

<sup>52</sup> See, e.g., §§ 56.115(b), 312.57, 312.62, 511.1(b)(7)(ii), 511.1(b)(8)(i), and 812.140(d).

<sup>53</sup> *Ibid.*

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

- 601       • The roles and responsibilities of the sponsor or other regulated entity and the IT service  
602       provider, including those related to quality and risk management. The sponsor is  
603       responsible for any duties and functions related to the clinical investigation not  
604       specifically and lawfully transferred to and assumed by an IT service provider (e.g., via a  
605       transfer of regulatory obligation (TORO)).<sup>54</sup>  
606
- 607       • Details regarding access to the data throughout the regulatory retention period.  
608

609       **Q18. What should sponsors and other regulated entities have available to demonstrate**  
610       **that the IT services are performed in accordance with FDA’s regulatory**  
611       **requirements?**  
612

613       Sponsors and other regulated entities who outsource IT services should make the following  
614       information available for FDA upon request:  
615

- 616       • SLAs and any other agreements that define the sponsor’s expectations of the IT service  
617       provider  
618
- 619       • All quality or risk management procedures related to the IT service  
620
- 621       • Documentation of ongoing oversight of IT services  
622

623       **Q19. Would FDA inspect or investigate IT service providers in a clinical investigation?**  
624

625       FDA may inspect IT service providers who have assumed obligations in an IND set forth in a  
626       TORO in writing as described in § 312.52. FDA can also request to conduct focused  
627       investigations of IT service providers for examination of trial records, regardless of whether a  
628       TORO is established. An investigation is a targeted information-gathering activity triggered by a  
629       specific regulatory concern; for example, concerns regarding the integrity of trial data.  
630       Regardless, the sponsor should have access to all study-related records maintained by IT service  
631       providers since those records may be reviewed during a sponsor inspection.<sup>55</sup>  
632

633       **D. Digital Health Technologies**  
634

635       For the purposes of this guidance, a DHT is a system that uses computing platforms,  
636       connectivity, software, and/or *sensors* for health care and related uses. DHTs may take the form  
637       of hardware and/or software.<sup>56</sup> In many instances, DHT software may run on general-purpose  
638       computing platforms (e.g., mobile phone, tablet, or smart watch).  
639

---

<sup>54</sup> See § 312.52.

<sup>55</sup> See, e.g., § 312.57 for specific requirements.

<sup>56</sup> In this guidance, the term *hardware* includes its firmware (i.e., software that is embedded within the hardware and that is essential to the core operation of the hardware). The term *software* refers to other software (e.g., a mobile application) that is not part of the hardware.

## Contains Nonbinding Recommendations

Draft — Not for Implementation

640 Sponsors, clinical investigators, and other regulated entities can use DHTs to record and transmit  
641 data during a clinical investigation. The recommendations in this section apply to DHTs used in  
642 a clinical investigation, whether the sponsor provides the DHT or the participants use their own  
643 DHTs.

644  
645 When final, the draft guidance for industry, investigators, and other stakeholders *Digital Health*  
646 *Technologies for Remote Data Acquisition in Clinical Investigations* (December 2021)<sup>57</sup> will  
647 provide recommendations for sponsors, clinical investigators, and other parties on the use of  
648 DHTs for **remote data acquisition** from participants in clinical investigations evaluating medical  
649 products. The draft guidance discusses, among other things, selection of DHTs for clinical  
650 investigations; verification, validation, and usability testing;<sup>58</sup> use of DHTs to collect data for  
651 clinical investigation endpoints; training on the use of DHTs; and identification and management  
652 of risks related to the use of DHTs in clinical investigations. The draft guidance also provides  
653 recommendations for designing clinical investigations incorporating DHTs.

654  
655 The principles previously discussed in sections III.A through C regarding electronic systems are  
656 applicable when DHTs are used to record data in a clinical investigation. In addition, the  
657 following questions and answers discuss specific considerations regarding part 11 compliance  
658 for data collection from DHTs in a clinical investigation.

659  
660 **Q20. When using DHTs to capture data from participants in clinical investigations, how**  
661 **do sponsors identify the data originator?**  
662

663 As part of an audit trail, each electronic data element should be associated with an authorized  
664 **data originator**. The data originator may be a person, a computer system, a DHT, or an EHR  
665 that is authorized to enter, change, or transmit data elements via a secure protocol into a  **durable**  
666 **electronic data repository**, such as an EDC system, a clinical investigation site database, and/or a  
667 vendor database (e.g., database of the CRO, IT service provider, DHT manufacturer).<sup>59</sup>  
668

669 If a participant manually enters data into the DHT (e.g., when using an ePRO app or when  
670 performing a task-based measure, such as a cognitive test) and the data are then uploaded into a  
671 durable electronic data repository, the clinical investigation participant should be identified as  
672 the data originator. In cases where another individual (e.g., clinical investigation personnel,  
673 health care provider, parent, or other caregiver) enters data on behalf of the clinical investigation  
674 participant, the individual entering the data should be identified as the data originator, and the  
675 reason should be documented.

---

<sup>57</sup> When final, this guidance will represent FDA's current thinking on this topic. Note that the draft guidance covers drugs, biologics, and devices.

<sup>58</sup> As used in the draft guidance for industry, investigators, and other stakeholders *Digital Health Technologies for Remote Data Acquisition in Clinical Investigations* (December 2021) (when final, this guidance will represent FDA's current thinking on this topic), the terms *verification* and *validation* are not intended to be synonymous with the terms defined in 21 CFR 820.3(aa) and 820.3(z) under the Quality System Regulation for devices (21 CFR part 820) or the terms *device software function verification* and *validation* as described in the guidance for industry and FDA staff *General Principles of Software Validation* (January 2002).

<sup>59</sup> See the 2013 guidance.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

676  
677 If a DHT, such as an activity tracker or a glucose sensor, transmits data automatically to the  
678 durable electronic data repository without any human intervention, the DHT should be identified  
679 as the data originator. In these cases, a ***data element identifier*** should be created that  
680 automatically identifies the particular DHT (e.g., name and type) as the originator of the data  
681 element. Other information associated with a data element, such as the date and time of entry  
682 and the unique identifier of the participant to whom it applies, should be recorded in the durable  
683 electronic data repository.

684  
685 In some cases, data from DHTs are obtained in the course of medical care and entered manually  
686 or automatically into an EHR. The EHR data can, in turn, under appropriate circumstances be  
687 used in a clinical investigation and entered into the EDC system. In this situation, identifying the  
688 EHR as the data originator is sufficient because sponsors are not expected to ascertain the details  
689 about all of the users and DHTs that contribute information to the patient's EHR.

690  
691 The sponsor should develop and maintain a list of authorized data originators, which should be  
692 available during an FDA inspection. When identification of data originators relies on unique  
693 codes, usernames, and passwords, access controls should be employed to ensure the security,  
694 authenticity, and integrity of the authorized usernames and passwords (see Q21).<sup>60</sup> When  
695 fingerprints or other biometrics are used by data originators in place of username and password  
696 combinations, controls should be designed to ensure that the biometrics cannot be used by  
697 anyone other than the data originator (see Q27).<sup>61,62</sup>

### **Q21. How should data attribution be ensured when DHTs are used to capture, transmit, and record data in clinical investigations?**

698  
699  
700  
701  
702 Sponsors should ensure that data obtained using DHTs are correctly attributed to the data  
703 originator. Approaches may include the use of access controls, education of participants, and  
704 data monitoring. Data attribution concerns should be addressed during protocol development  
705 and at the time of DHT selection.

706  
707 DHTs should be designed to prevent unauthorized changes to the data stored on the DHT before  
708 data are transmitted to and recorded in a durable electronic data repository. Access controls  
709 (e.g., biometrics, multi-factor authentication) should be in place for a ***mobile application*** that  
710 relies on user entry of data to ensure that entries come from the clinical investigation  
711 participants, personnel, or other individuals authorized to enter the data (e.g., health care  
712 providers, parents, or other caregivers).<sup>63</sup> Clinical investigation personnel, participants, and

---

<sup>60</sup> See §§ 11.10(d) and (g) and 11.30 (for additional information related to the requirements to limit system access to authorized individuals and the use of authority checks to ensure that only authorized individuals can access and use the system).

<sup>61</sup> See § 11.200(b) (for additional information related to the rule regarding electronic signatures based upon biometrics).

<sup>62</sup> See the 2013 guidance.

<sup>63</sup> See footnote 60.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

713 other individuals should use their own usernames and passwords and not share them with others  
714 or use access controls belonging to others (e.g., biometrics).

715  
716 For certain DHTs (e.g., wearable sensors), access controls may be difficult to implement.  
717 Sponsors should consider how they will address user authentication and data attribution for these  
718 DHTs, particularly when the data collected from such DHTs will be used to support a clinical  
719 investigation endpoint. The clinical investigator should discuss the appropriate use of such  
720 DHTs with participants. Clinical investigation participants should be instructed that only they  
721 should wear or use such DHTs. This discussion should be documented in the clinical  
722 investigation records. Periodic monitoring of DHT data during the clinical investigation can help  
723 to identify situations where data may be coming from individuals other than the intended user.  
724

725 **Q22. What should be considered during the initial transfer of the data from a DHT to the**  
726 **durable electronic data repository?**

727  
728 Data captured from a DHT and any relevant associated metadata should be transmitted to a  
729 durable electronic data repository according to the sponsor's pre-specified plan. The durable  
730 electronic data repository can be owned by sponsors or by vendors such as IT service providers.  
731 Transmission should occur contemporaneously or as soon as possible after data are generated.  
732 The date and time the data are transferred from the DHT to the electronic data repository should  
733 be included in the audit trail. Source data captured by a DHT can be subsequently moved from  
734 one durable electronic data repository to a different durable electronic data repository using a  
735 validated process.  
736

737 **Q23. What is the location of the source data collected by a DHT, and what DHT-collected**  
738 **data would FDA intend to inspect during an inspection?**

739  
740 Electronic source data are considered to be located in the first durable electronic data repository  
741 (e.g., EDC system, clinical investigation site database, cloud-based digital platform) to which the  
742 data are transferred. FDA does not intend to inspect individual DHTs for source data when the  
743 data captured by the DHT, including all associated metadata, are securely transferred to and  
744 retained in the durable electronic data repository according to the sponsor's pre-specified plan.  
745

746 FDA may verify the data the sponsor submits in support of an application or submission against  
747 the electronic source data during an inspection.<sup>64</sup> As discussed in the 2003 part 11 guidance,  
748 FDA intends to exercise enforcement discretion with regard to the requirements for generating  
749 copies of records in human readable and electronic form for inspection, review, and copying by  
750 the Agency (§ 11.10(b) and any corresponding requirement in §11.30).<sup>65</sup> However, such records  
751 are also subject to requirements under predicate rules.<sup>66</sup> FDA recommends that sponsors allow  
752 for the inspection, review, and copying of such records in human readable form.<sup>67</sup>

---

<sup>64</sup> See § 11.10(b).

<sup>65</sup> See the 2003 part 11 guidance.

<sup>66</sup> See, e.g., §§ 211.180(c) and (d).

<sup>67</sup> See the 2003 part 11 guidance.

### **E. Electronic Signatures**

An electronic signature is a computer data compilation of any symbol or series of symbols executed, adopted, or authorized by an individual to be the legally binding equivalent of the individual's handwritten signature.<sup>68</sup> In general, a signature may not be denied legal effect or validity solely because it is in an electronic format, and a record relating to a transaction may not be denied legal effect, validity, or enforceability solely because an electronic signature or electronic record was used in its formation.<sup>69</sup>

In general, electronic signatures and their associated electronic records that meet all applicable requirements under part 11 will be considered to be equivalent to handwritten signatures.<sup>70</sup> Part 11 specifies that signed electronic records must contain the printed name of the signer, the date and time when the signature was executed, and the meaning associated with the signature.<sup>71</sup> In addition, electronic signatures must be linked to the respective electronic records to ensure that the signatures cannot be excised, copied, or otherwise transferred to falsify an electronic record by ordinary means.<sup>72</sup> In situations where electronic signatures cannot be placed in a specified signature block, a statement of testament (e.g., "I approved the contents of this document") should be placed elsewhere in the document to state the meaning of the signature and link the signature to the electronic record.

#### **Q24. What methods might be used to create valid electronic signatures?**

Part 11 regulations do not specify a particular method to confirm the user's identity when creating electronic signatures. Examples of methods used to create valid electronic signatures include, but are not limited to, the use of computer-readable ID cards, biometrics, *digital signatures*, and username and password combinations.

Various COTS electronic signature services are available to create electronic signatures. Sponsors, clinical investigators, and other regulated entities should ensure that these services conform to part 11 requirements based on information from the COTS vendors or their own validation of the services when warranted.

---

<sup>68</sup> See § 11.3(b)(7).

<sup>69</sup> See the Government Paperwork Elimination Act (GPEA), enacted on October 21, 1998 (Public Law 105-277), and the Electronic Signatures in Global and National Commerce Act, enacted on June 30, 2000 (Public Law 106-229, 114 Stat. 464) (15 U.S.C. 7001-7006).

<sup>70</sup> See § 11.1(c).

<sup>71</sup> See § 11.50.

<sup>72</sup> See § 11.70.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

786 **Q25. Does FDA consider signatures drawn with a finger or an electronic stylus on a**  
787 **mobile platform or other electronic system to be electronic signatures?**  
788

789 No. Signatures drawn with a finger or an electronic stylus are considered handwritten  
790 signatures.<sup>73</sup> A handwritten signature executed to an electronic record must be linked to its  
791 respective electronic record.<sup>74</sup> The handwritten signature should be placed on the electronic  
792 document just as it would appear on a printed document to link the signature to the respective  
793 electronic record.  
794

795 **Q26. How should sponsors and regulated entities verify the identity of the individual who**  
796 **will be electronically signing records as required in § 11.100(b)?**  
797

798 Part 11 regulations do not specify a particular method for verifying the identity of the individual  
799 who will be electronically signing records.<sup>75</sup> Methods for verifying someone's identity may  
800 include, but are not limited to, use of official Government-issued identification, security  
801 questions, or strong digital login credentials accompanied by multi-factor authentication or video  
802 observation.  
803

804 **Q27. What requirements must an electronic signature based on biometrics meet to be**  
805 **considered acceptable?**  
806

807 Biometrics are “a method of verifying an individual's identity based on measurements of the  
808 individual's physical feature(s) or repeatable action(s) where those features and/or actions are  
809 both unique to that individual and measurable.”<sup>76</sup> Examples of biometrics may include, but are  
810 not limited to, fingerprints, hand geometry (i.e., finger length and palm size), iris patterns, retinal  
811 patterns, or voice prints.  
812

813 Electronic signatures based on biometrics must be designed to ensure that they cannot be used by  
814 anyone other than their genuine owners.<sup>77</sup> Suitable biometrics should be uniquely identified with  
815 the individual and should not change over time.  
816

817 Electronic signatures based on biometrics that meet the requirements under part 11 subpart C are  
818 considered trustworthy, reliable, and generally equivalent to handwritten signatures.<sup>78</sup>  
819

---

<sup>73</sup> See § 11.3(b)(8).

<sup>74</sup> See § 11.70.

<sup>75</sup> See § 11.100.

<sup>76</sup> See § 11.3(b)(3).

<sup>77</sup> See § 11.200(b).

<sup>78</sup> See §§ 11.1(a) and (c).

*Contains Nonbinding Recommendations*

*Draft — Not for Implementation*

820 **Q28. Does FDA certify electronic systems and methods used to obtain electronic**  
821 **signatures?**

822  
823 No. FDA does not certify individual electronic systems and methods used to obtain electronic  
824 signatures. FDA would consider an electronic signature to be trustworthy, reliable, and generally  
825 equivalent to handwritten signatures if electronic signatures and their associated electronic  
826 records meet the requirements of part 11,<sup>79</sup> regardless of the particular technology or brand used.  
827 Sponsors should work with COTS electronic signature service vendors to ensure compliance  
828 with part 11.  
829

**Audits:** Systematic and independent examinations of trial-related activities and documents to determine whether the evaluated trial-related activities were conducted and the data were recorded, analyzed, and accurately reported according to the protocol, sponsor’s standard operating procedures (SOPs), good clinical practice (GCP), and the applicable regulatory requirements.<sup>80</sup>

**Audit Trails:** Processes that capture details such as additions, deletions, or alterations of information in an electronic record without obscuring the original record. Audit trails facilitate the reconstruction of the course of such details relating to the electronic record.<sup>81</sup> Audit trails typically capture each change itself, the individual making the change, the data and time of the change and, when applicable, the reason or reasons for the change.

**Biometrics:** Methods of verifying an individual’s identity based on measurements of the individual’s physical features or repeatable actions where those features and/or actions are both unique to that individual and measurable.<sup>82</sup>

**Certified Copy:** A copy (irrespective of the type of media used) of the original record that has been verified (i.e., by a dated signature or by generation through a validated process) to have the same information, including data that describe the context, content, and structure, as the original.<sup>83</sup>

**Cloud Computing:** A model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction.<sup>84</sup>

**Commercial Off-the-Shelf (COTS) System:** A commercially available electronic system (including hardware or software) that can be purchased from third-party vendors.

**Customized Electronic System:** System and software including functionalities that are adapted for the needs of the clinical investigation.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

864 **Data Element:** A single observation associated with a subject in a clinical study. Examples  
865 include birth date, white blood cell count, pain severity measure, and other clinical observations  
866 made and documented during a study.<sup>85</sup>

867  
868 **Data Element Identifier:** The information associated with a data element that includes the  
869 origin of the data element, the date and time of entry, and the identification number of the study  
870 subject to whom the data element applies. Once set by the electronic system, this value should  
871 not be alterable in any way.<sup>86</sup>

872  
873 **Data Originator:** Each data element is associated with an origination type that identifies the  
874 source of its capture in the eCRF. This could be a person, a computer system, a device, or an  
875 instrument that is authorized to enter, change, or transmit data elements into the eCRF (also  
876 sometimes known as an author).<sup>87</sup>

877  
878 **Digital Health Technology (DHT):** A system that uses computing platforms, connectivity,  
879 software, and/or sensors for health care and related uses. These technologies span a wide range  
880 of uses, from applications in general wellness to applications as a medical device. They include  
881 technologies intended for use as a medical product, in a medical product, or as an adjunct to  
882 other medical products (devices, drugs, and biologics). They may also be used to develop or  
883 study medical products.<sup>88</sup>

884  
885 **Digital Signatures:** Electronic signatures based upon cryptographic methods of originator  
886 authentication, computed by using a set of rules and a set of parameters such that the identity of  
887 the signer and the integrity of the data can be verified.<sup>89</sup>

888  
889 **Durable Electronic Data Repository:** An enduring database that is electronically protected  
890 from alterations and maintained until the end of the record retention period.

891  
892 **Electronic Case Report Forms (eCRFs):** Auditable electronic records of information that  
893 generally are reported to the sponsor on each participant, according to a clinical investigation  
894 protocol. An eCRF enables clinical investigation data to be systematically captured, reviewed,  
895 managed, stored, analyzed, and reported.<sup>90</sup>

896

<sup>86</sup> Ibid.

<sup>87</sup> Ibid.

<sup>88</sup> See the draft guidance for industry, investigators, and other stakeholders *Digital Health Technologies for Remote Data Acquisition in Clinical Investigations*. When final, this guidance will represent FDA's current thinking on this topic. This draft guidance covers drugs, biological products, and devices. See also BEST (Biomarkers, EndpointS, and other Tools) Resource Glossary (2016), available at <https://www.ncbi.nlm.nih.gov/books/NBK338448>.

<sup>89</sup> See § 11.3(b)(5).

<sup>90</sup> See the 2013 guidance.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

897 **Electronic Data Capture (EDC) Systems:** Electronic systems designed to collect, manage, and  
898 store clinical investigation data in an electronic format.

899  
900 **Electronic Health Record (EHR) System:** An electronic platform that contains individual  
901 health records for patients. EHR systems are generally maintained by health care providers,  
902 health care organizations, and health care institutions and are used to deliver care.<sup>91</sup>

903  
904 **Electronic Records:** Any combination of text, graphics, data, audio, pictorial, or other  
905 information representation in digital form that is created, modified, maintained, archived,  
906 retrieved, or distributed by a computer system.<sup>92</sup>

907  
908 **Electronic Signatures:** Computer data compilation of any symbol or series of symbols  
909 executed, adopted, or authorized by individuals to be the legally binding equivalent of the  
910 individuals' handwritten signatures.<sup>93</sup>

911  
912 **Electronic Systems:** Systems, including hardware and software, that produce electronic records.

913  
914 **Information Technology (IT) Services:** Data hosting and/or computing services, such as  
915 software as a service, platform as a service, and infrastructure as a service.

916  
917 **IT Service Provider:** A vendor who provides IT services to sponsors and other regulated  
918 entities.

919  
920 **Medical Claims Data:** The compilation of information from medical claims that health care  
921 providers submit to insurers to receive payment for treatments and other interventions. Medical  
922 claims data use standardized medical codes, such as the World Health Organization's  
923 International Classification of Diseases Coding (ICD-CM) diagnosis codes, to identify diagnoses  
924 and treatments.<sup>94</sup>

925  
926 **Metadata:** The contextual information required to understand the data. Metadata is structured  
927 information that describes, explains, or otherwise makes it easier to retrieve, use, or manage data.  
928 Examples of metadata include units of the data (e.g., mg), a date and time stamp for when the  
929 data were acquired, data originator, and other audit trail information associated with the data.

930  
931 **Mobile Application:** A software application that can be executed (run) on a mobile platform  
932 (i.e., a handheld COTS computing platform, with or without wireless connectivity) or a web-  
933 based software application that is tailored to a mobile platform but is executed on a server.<sup>95</sup>

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

934

935 **Registries:** Organized systems that collect clinical and other data in standardized formats for  
936 populations defined by a particular disease, condition, or exposure.<sup>96</sup>

937

938 **Real-World Data (RWD):** Data relating to individual patient health status or the delivery of  
939 health care routinely collected from a variety of sources. Examples of RWD include data from  
940 EHRs; *medical claims data*; data from product and disease *registries*; patient-generated data  
941 (including data from in-home use settings); and data gathered from other sources that can inform  
942 on health status, such as DHTs.

943

944 **Remote Data Acquisition:** Collection of data from locations that are distant from the  
945 investigator or trial personnel.<sup>97</sup>

946

947 **Sensor:** A transducer that converts a physical, biological, or chemical parameter into an  
948 electrical signal; for example, temperature, pressure, flow, or vibration sensor. A sensor is  
949 typically hardware.<sup>98</sup>

950

951 **Service Level Agreements (SLAs):** Formal, negotiated documents that define the terms of  
952 service being offered to a customer.

953

954 **Source Data:** All information in original records and certified copies of original records of  
955 clinical findings, observations, or other activities in a clinical investigation necessary for the  
956 reconstruction and evaluation of the clinical investigation. Source data are contained in *source*  
957 *documents* (original records or certified copies).<sup>99</sup>

958

959 **Source Documents:** Original documents, data, and records (e.g., hospital records; clinical and  
960 office charts; laboratory notes; memoranda; subjects' diaries or evaluation checklists; pharmacy  
961 dispensing records; recorded data from automated instruments; copies or transcriptions certified  
962 after verification as being accurate copies; microfiches; photographic negatives; microfilm or  
963 magnetic media; x-rays; subject files; and records kept at the pharmacy, at the laboratories, and  
964 at medico-technical departments involved in the clinical investigation).<sup>100</sup>

965

966 **User Acceptance Testing (UAT):** A phase of testing in which users test the electronic system to  
967 ensure it can handle required tasks according to specifications.

968  
969 **Validation:** A process of establishing and documenting that the specified requirements of an  
970 electronic system can be consistently fulfilled from design until decommissioning of the system  
971 or transition to a new system.<sup>101</sup>  
972  
973 **Vendor:** A supplier that sells electronic goods or services to sponsors and other regulated  
974 entities.

### **APPENDIX: RELEVANT GUIDANCE DOCUMENTS**

The following guidance documents, among others, have additional information pertaining to 21 CFR part 11.<sup>1</sup> They are listed in the order referenced in this guidance document.

1. Guidance for industry *Part 11, Electronic Records; Electronic Signatures — Scope and Application* (August 2003).
2. Guidance for industry *E6(R2) Good Clinical Practice: Integrated Addendum to ICH E6(R1)* (March 2018).
3. Guidance for industry *Use of Electronic Health Records Data in Clinical Investigations* (July 2018).
4. Guidance for industry and FDA staff *Acceptance of Clinical Data to Support Medical Device Applications and Submissions: Frequently Asked Questions* (February 2018).
5. Guidance for industry *Q9(R1) Quality Risk Management* (June 2022).
6. Guidance for industry *Electronic Source Data in Clinical Investigations* (September 2013).
7. Draft guidance for industry, investigators, and other stakeholders *Digital Health Technologies for Remote Data Acquisition in Clinical Investigations* (December 2021).<sup>2</sup>
8. Guidance for institutional review boards, investigators, and sponsors *Use of Electronic Informed Consent in Clinical Investigations: Questions and Answers* (December 2016).
